LC75343M

Electronic Volume Control System on-Chip

Overview

The LC75343M is an electronic volume system that can control the volume, balance, 2-band equalizer, super bass, and input switching functions by serial data input.

Functions

- Volume: 0 dB to –78 dB (1-dB step) and –∞ (64 positions)
  0 dB to –50 dB (1-dB step), –50 dB to –70 dB (2-dB step), –70-dB to –78 dB (4-dB step)
  Balance function with separate L/R control
- Treble: ±10-dB control in 2-dB steps is possible. Shelving characteristic.
- Bass*: ±10-dB control in 2-dB steps is possible. Peaking characteristics.
- Super bass*: +10-dB control in 2-dB steps is possible. Peaking characteristics.
  (+/–10 dB control in 2-dB steps is possible depending on software support and the application. Peaking characteristics.)
- Selector: 5 input signals can be selected both for L and R
- Input gain: 0 dB to +30 dB (2-dB step) amplification is possible for the input signal.
- General-purpose amp (ATT): 2 on-chip general-purpose amplifiers
  (0-dB to –18-dB in 2-dB steps and –∞ 11 positions attenuate control is possible, depending on software support and the application)

Note*: Regarding (Bass) and (Super bass) above, MID and BASS functions can also be realized by changing the capacitor capacitance.

Features

- On-chip buffer amplifier cuts down number of external components
- Low switching noise generated by on-chip switch due to use of silicon gate CMOS process
- On-chip reference voltage circuit for analog ground
- Controls performed with serial data input (CCB)

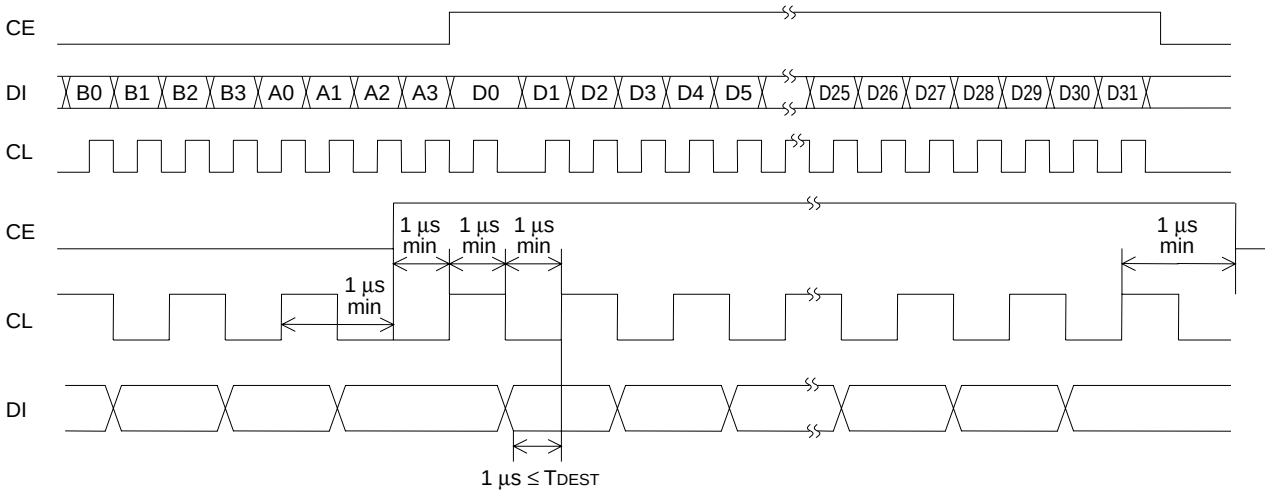
Control Timing and Data Format

To control the LC75343M, input specified serial data to the CL, DI, and CE pins. The data configuration consists of a total of 40 bits broken down into 8 address bits and 32 data bits.



Address Code (B0 to A3)

The LC75343M has an 8-bit address code and common specifications with a SANYO serial bus CCB IC are possible.

During boost, SW1 and SW3 are on, during cut, SW2 and SW4 are on, when 0 dB, 0dBSW and SW2 and SW3 are on.

For the super bass block:

- In case of general-purpose op-amp specifications, ATT control specifications (“0” set to D3)
  SW3, SW4 are off, and only boost side operates (only SW1 is on).

- In case of 3-band specifications (“1” set to D3)
  During boost, SW1 and SW3 are on, during cut, SW2 and SW4 are on, when 0 dB, 0dBSW and SW2 and SW3 are on.

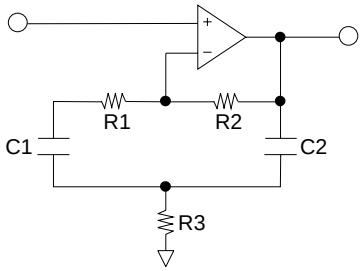
Calculation of External Equalizer Constant

Bass/Super Bass Circuit

The equivalent circuit and the formula for calculating the external RC with a mean frequency of 1000 Hz are shown below.

- Bass/super bass band equivalent circuit block diagram



- Calculation example

  Specification Mean frequency: f0 = 1000 Hz
  Gain during maximum boost: G = 10 dB
  Using R1 = 0, R2 = 33.097 kΩ, and C1 = C2 = C,

We obtain R2 from G = 10 dB.

$$G_{+10\,dB} = 20 \times LOG_{10}\left(1 + \frac{R2}{2R3}\right)$$

$$R3 = \frac{R2}{2\left(10^{G+10dB/20} - 1\right)} = \frac{33097}{2 \times (3.162 - 1)} \neq 7.6\ K\Omega$$

We obtain C from mean frequency f0 = 1000 Hz.

$$f0 = \frac{1}{2\pi\sqrt{R3R2C1C2}}$$

$$C = \frac{1}{2\pi f0\sqrt{R3R2}} = \frac{1}{2\pi \times 1000\sqrt{33097 \times 7600}} \neq 0.01\ \mu F$$

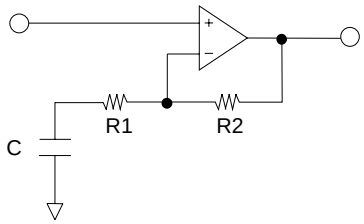
We obtain Q.

$$Q = \frac{R3R2}{2R3}\ \frac{1}{\sqrt{R3R2}} \neq 1.04$$

Treble Band Circuit

The shelving characteristics can be obtained for the treble band.

The equivalent circuit and calculation formula during boost are indicated below.



- Calculation example

  Specification Set frequency: f = 26000 Hz

  Gain during maximum boost: $G_{+10\ dB} = 10$ dB

  Using R1 = 16.240 kΩ and R2 = 35.461 kΩ, and inserting the above values in the following formula, we obtain:

$$G = 20 \times LOG_{10}\left(1 + \frac{R2}{\sqrt{R1^2 + (1 / \omega C)^2}}\right)$$

$$C = \frac{1}{2\pi f\sqrt{(\frac{R2}{10^{G/20} - 1})^2 - R1^2}}$$

$$= \frac{1}{2\pi 26000\sqrt{(\frac{35461}{3.16-1})^2 - 16240^2}} \neq 2700(pF)$$

Usage Cautions

- Upon power application, the internal analog switch status is undefined. Use an external countermeasure such as muting until data is set.
- When performing initial setting after applying power, send the initial setting data for the left and right channels prior to canceling mute.
- To ensure that the high-frequency digital signals sent to the CL, DI, and CE pins do not spill over to the analog signal block, either guard these signal lines with a ground pattern, or perform transmission using shielded wires.
